□ Salesforce Summer Program – Day 3

□ Goal for Today

By end of today, you should understand:

- What are Objects, Fields and Records
- Standard vs Custom Objects
- Relationship types in Salesforce
- Why enterprise systems need structured data
- What are Formula Fields and Validation Rules

□ Trailhead Modules (COMPLETE TODAY)

Follow this order strictly:

1□ Data Modeling (~45 mins)

Focus on:

- Objects
- Fields
- Records
- Relationships
- Schema Builder

2□ Formulas and Validations (~1 hr)

Focus on:

- Formula Fields
- Validation Rules
- Business logic without coding

3□ OPTIONAL (Only if time permits)

Customize a Salesforce Object

 Do NOT stress about completing this today.

Videos (Watch ONLY These)

1 Objects, Fields and Records in Salesforce

https://www.youtube.com/watch?v=1D8xiWPozZA

Focus:

- What is an Object
- What is a Record
- What is a Field
- Real examples

---

2 App vs Object vs Tab Explained

https://www.youtube.com/watch?v=HoeK6-sKNz8

Focus:

- App vs Object vs Tab
- Standard vs Custom Objects
- Real business mapping

---

3 Lookup Relationship Explained

https://www.youtube.com/watch?v=OBnDHMpCR8s

Focus:

- Lookup Relationships
- Why relationships matter
- Junction objects
- Real-world examples

---

4 Formula Fields vs Validation Rules

https://www.youtube.com/watch?v=BszNY4cpdJo

Focus:

- Difference between calculation vs restriction
- Real-world business logic
- When to use Formula Fields
- When to use Validation Rules

CORE TASKS (MANDATORY)

Task 1 Design a College Management System

Create these objects:

- Student
- Faculty
- Course
- Department

Now think carefully:

- Which objects are related?
- One-to-many relationships?
- Which relationships should be Lookup?

Task 2 Formula Thinking

Suggest 3 Formula Fields.

Examples:

- Full Name
- Remaining Seats
- Percentage

Explain:
Why should this be calculated automatically?

Task 3 □ + Validation Rule Thinking

Suggest 3 Validation Rules.

Examples:

- Email cannot be empty
- Student age cannot be negative
- Course seats cannot exceed limit

Explain:
□ What bad data/problem does this prevent?

Task 4 □ + Reflection Task (MOST IMPORTANT)

Answer in your own words:

□ Why do companies need structured data instead of random spreadsheets?

□ GitHub Submission

Create:

/day3-data-modeling/

README.md must include:

---

1. Difference Between:

- App
- Object
- Record
- Field

---

2. Standard vs Custom Objects

---

3. Your College Data Model

Include:

- Objects
- Relationships
- Diagram/image

---

4. Formula Fields

(Your examples + explanation)

---

5. Validation Rules

(Your examples + explanation)

---

6. Reflection

Why structured enterprise data matters

✍ Reflective Questions

1. Why can’t companies manage everything using Excel sheets?
2. Why are relationships important between objects?
3. What problems happen if data is inconsistent?
4. Why should repetitive calculations be automated?
5. Why should invalid data be blocked early?
6. Why is Salesforce called a metadata-driven platform?

Rules

- Do NOT blindly copy answers
- Think in terms of REAL systems
- Focus deeply on relationships and business logic
- Spend around 3 hours maximum

□ End of Day Outcome

You should now clearly understand:

- How Salesforce stores business data
- How enterprise systems are structured
- Why relationships are critical
- Difference between Formula Fields and Validation Rules
- How no-code business logic works
