□ Salesforce Summer Program – Day 6

□ Goal for Today

By end of today, you should understand:

- How Salesforce stores and retrieves data
- What is SOQL
- What are Apex Triggers
- How systems react automatically to events
- Difference between Flows and Triggers

□ Trailhead Modules (COMPLETE TODAY)

Follow this order strictly:

1□ Database & .NET Basics (~55 mins)

Focus on:

- SOQL
- SOSL
- DML operations
- Querying data

2□ Apex Triggers (~1 hr 30 mins)

Focus on:

- What are Triggers
- Before vs After triggers
- Event-driven logic
- Real-world examples

□ Videos (Verified Working Links)

1 SOQL Basics for Beginners

https://www.youtube.com/watch?v=7Ye0sZxw7K8

Focus:

- Query syntax
- Retrieving records
- Real examples

---

2 Salesforce Apex Triggers Tutorial

https://www.youtube.com/watch?v=1SN8QYBQ0Hw

Focus:

- Trigger events
- Before insert
- After update
- Business logic

---

3 Apex Triggers Explained Simply

https://www.youtube.com/watch?v=R9s2k6g8m9Q

Focus:

- Trigger lifecycle
- Automation flow
- Real-world examples

---

4 SOQL vs SQL

https://www.youtube.com/watch?v=ZK6Yx3Yk5QQ

Focus:

- Similarities and differences
- Salesforce-specific querying

□ CORE TASKS (MANDATORY)

Task 1 □ → Trigger Thinking

Take your College Management System.

Suggest 5 cases where actions should happen automatically AFTER data changes.

Examples:

- After student registration → send welcome email
- After course becomes full → notify faculty
- After attendance drops → send warning

Explain:
□ What event triggers the action?

Task 2 □ → Flow vs Trigger Thinking

For each case below, decide:

□ Should this be done using:

- Flow
  OR
- Apex Trigger

And explain WHY.

Examples:

- Simple email notification
- Complex fee eligibility check
- Updating related records
- External API integration

Task 3 □ → Query Thinking

Suppose you have:

- Students

- Courses
- Faculty

Write simple English queries like:

- Find all students in Course A
- Find all courses handled by Faculty X
- Find students with attendance below 75%

 No need for perfect SOQL syntax yet.

Task 4 + Reflection Task (MOST IMPORTANT)

Answer:

 Why do enterprise systems need event-driven behavior?

GitHub Submission

Create:

/day6-triggers-soql/

README.md must include:

---

1. What is SOQL?

---

2. What is an Apex Trigger?

---

3. Difference:

- Flow vs Trigger
- Before vs After Trigger

---

4. Your Trigger Use Cases

(5 examples)

---

5. Query Examples

(Your English query ideas)

---

6. Reflection

Why enterprise systems react automatically to data changes

✍ □ Reflective Questions

1. Why do systems need triggers?
2. Difference between polling and event-driven systems?
3. Why are database queries important?
4. When should Flows be preferred over Triggers?
5. What problems happen if automation logic becomes too complex?
6. Why should developers think carefully before automating actions?

□ □ Rules

- Focus on business thinking first
- Understand events deeply
- Do NOT memorize syntax blindly
- Use real-world examples
- Spend around 3–4 hours maximum

□ End of Day Outcome

You should now clearly understand:

- How Salesforce queries data
- How event-driven systems work

- What Apex Triggers do
- Difference between declarative and programmatic automation
- How enterprise systems react intelligently to data changes
