Understand How Lightning Web Components Work with Aura Components

Learning Objectives

After completing this unit, you'll be able to:

- List the benefits of Lightning web components.
- Describe how Aura components and Lightning web components can work together.
- Decide when it makes sense to migrate components.

A New Programming Model

You can now develop Lightning components in two programming models: the original model—Aura Components, and the new model—Lightning Web Components. Just when you've mastered developing Aura components, we've come up with Lightning web components! Why, oh why, you ask? Well, we created the Lightning Web Components model to align with web standards that didn't exist several years ago when we built the original Aura model.

Did you notice a capitalization difference in that last paragraph? If so, you have a keen eye. We capitalize all the words when we refer to the Lightning Web Components programming model. We only capitalize the first word when we refer to the components, themselves, as Lightning web components.

Similarly, the programming model you've been using is now called the Aura Components programming model, and you create Aura components.

To belabor the point, in the Lightning Web Components programming model, you create Lightning web components. In the Aura Componenter programming model, you create Aura components.

What Is Lightning Web Components?

Lightning Web Components is an implementation of the W3C's Web Components standards. It supports the parts of web components that perform well in browsers, and adds only what's needed to work in all browsers supported by Salesforce.

Understand How Lightning Web Components Work with Aura Components

What Are the Benefits of Lightning Web Components?

- **Modern JavaScript:** The JavaScript language with ES6+ and web standards, such as HTML templates, custom elements, and web components have evolved significantly in the last few years. Lightning Web Components brings modern JavaScript and web standards to the Lightning Component framework.
- **Developer Productivity and Satisfaction:** Learn to build Lightning web components more quickly because you're using standard JavaScript, HTML, and CSS. There are proprietary components and APIs that make it easier to work with Salesforce, but you access and use these proprietary pieces in a standard way. Write less code with Lightning web components and that code is easier to read, maintain, and unit test. Find answers to your development questions more easily by going to your favorite search engine. Working with web standards speeds up development and debugging time. Use your favorite development tools because Lightning web components use standard JavaScript and play well with your tools of choice.
- **Code Performance:** Using web standards boosts performance because more features are executed natively by the browser instead of by a JavaScript framework. This improvement can vary depending on your use case, but we believe that you'll be pleasantly surprised with the quicker rendering time for your components.

Prerequisites

Before you dive into this module, complete the [Lightning Web Components Basics](https://trailhead.salesforce.com/content/learn/modules/lightning-web-components-basics) (<https://trailhead.salesforce.com/content/learn/modules/lightning-web-components-basics>) module, which gives you a great introduction to the new programming model.

We're assuming that you're familiar with the Aura Components programming model, and we won't explain its features, except in comparison to the Lightning Web Components programming model. If you're not familiar with Aura components, start with the [Lightning Aura Components Developer Guide](https://developer.salesforce.com/docs/atlas.en-us.lightning.meta/lightning/) (<https://developer.salesforce.com/docs/atlas.en-us.lightning.meta/lightning/>).

Lightning web components.

Buckle Up for a Journey

Understand How Lightning Web Components Work with Aura Components
Learning any new programming model or language is a journey. When you get some new code running, it can feel like the thrill of driving a convertible on an open road. Then you change a line of code and you get an error. You slam on the brakes, but you've hit a traffic jam and you desperately search for the next exit. Remember, it's a journey. The error is just a temporary slowdown, and you'll get to your destination in the end... hopefully, before dinner time.

We hope that this module prepares you for your Lightning web components journey. Think of the module as packing your suitcase for your trip. We step you through everything you need for the adventure. When you reach your destination, we don't want you to open your suitcase and realize that you forgot to pack any underwear!

Components Living and Working Together

Let's start by looking at how you piece components together. You can add components within the body of another component. This component composition enables you to build complex components from simpler building-block components. The concept of component composition is fundamental to both Aura components and Lightning web components.

We know that you may have invested a lot of time and effort into developing Aura components. So we've invested the time to enable you to compose Aura components and Lightning web components in the same application. For example, you can write a new Lightning web component and add it to an app that contains Aura components.

In addition to composing Aura components and Lightning web components together, the two types of components can communicate with events. It's a healthy coexistence.

Like any relationship, there are rules that ensure that composed components play well together.

Important

body, those subcomponents must also be built as Lightning web components.

Remember that Lightning web components can't contain Aura components.

[Lightning Web Components for Aura Developers \(/content/learn/modules/lightning-web-components-for-aura-developers?trailmix_creator_id=srebello7&trailmix_slug=salesforce-platform-developer\)](https://trailhead.salesforce.com/content/learn/modules/lightning-web-components-for-aura-developers?trailmix_creator_id=srebello7&trailmix_slug=salesforce-platform-developer)
If a Lightning web component is the outermost component in a tree of nested components, none of the nested components can be an Aura component.

Understand How Lightning Web Components Work with Aura Components

One of the advantages of the two programming models working together is that you can decide to migrate one Aura component to a Lightning web component and your app continues to function. Even if you decide to use Lightning web components for new components, you can still leverage any existing investment in Aura components.

Also, you can write new code in an ES6 module, and access the code from a Lightning web component and an Aura component. This pattern opens the door to modern JavaScript development for Aura developers.

Migration Strategy

Migrating code is rarely a straight path. The programming model for Lightning Web Components is fundamentally different than the model for Aura Components. Migrating an Aura component to a Lightning web component is not a line-by-line conversion, and it's a good opportunity to revisit your component's design. Before you migrate an Aura component, evaluate the component's attributes, interfaces, structures, patterns, and data flow.

The easiest components to migrate are simple components that only render UI. An Aura component whose performance is critical is a good candidate to migrate to a Lightning web component.

You get more gains in performance and developer productivity by migrating larger trees of components (components within components) rather than an individual component. However, it's a useful learning experience to migrate one component and see how concepts in the Aura programming model map to concepts in the Lightning Web Components programming model.

After migrating one component, you'll be in a better position to determine whether it makes sense for you and your org to:

- Undertake a larger migration effort.
- Use Lightning web components for new components only.
- Stick with Aura components for now.

Quiz

To complete this unit, you need to answer all the quiz questions correctly.

+100 Points

1 True or false: An Aura component can contain a Lightning web component.

A True

B False

2 When should you consider migrating an Aura component to a Lightning web component?

A The Aura component is rarely used.

B The Aura component uses CSS.

The Aura component uses Apex.

[Lightning Web Components for Aura Developers \(/content/learn/modules/lightning-web-components-for-aura-developers?trailmix_creator_id=srebello7&trailmix_slug=salesforce-platform-developer\)](/content/learn/modules/lightning-web-components-for-aura-developers?trailmix_creator_id=srebello7&trailmix_slug=salesforce-platform-developer)
Second attempt earns 50 points. Three or more earns 25 points.
