

☐ Salesforce Summer Program – Day 13 (4–5 Hours)

☐ Goal for Today

Until now you learned:

- Salesforce development
- automation
- Apex
- LWC
- testing
- DX workflow
- GitHub collaboration

Today's focus is:

“How real Salesforce systems are deployed and maintained in teams.”

You will now understand:

- CI/CD basics
- deployment pipelines
- GitHub Actions
- DevOps thinking
- enterprise release management

This is the final transition from:

☐ “learning Salesforce”

to

☐ “understanding professional software delivery.”

☐ Deep Learning Modules (IMPORTANT)

1 ☐ Org Development Model

Focus:

- Sandbox strategy
- Development lifecycle
- Team workflow

- Deployment flow
-

2 ☐ Salesforce DevOps / Deployment Workflow

Focus:

- CI/CD basics
- Automated deployment
- Validation before production release
- Release management

☐ Focus on concepts, NOT deep configuration.

☐ Light Completion Modules

3 ☐ Agentforce DX (Overview)

Focus:

- AI-enabled developer workflow
 - Modern Salesforce tooling ecosystem
-

4 ☐ Visualforce + Aura (if pending)

☐ Exposure only.

☐ Videos (Verified Working Links)

1 ☐ Salesforce DX + Git + CI/CD Pipeline

<https://www.youtube.com/watch?v=qegFqum-M9o>

Focus:

- GitHub workflow
- CI/CD concepts
- Salesforce deployment pipeline

- DevOps mindset

Channel:
Coding With The Force

2 Salesforce DevOps Using GitHub Actions

<https://www.youtube.com/watch?v=eybYM1Hw-9I>

Focus:

- GitHub Actions
- Automated deployment
- Team workflow
- DevOps concepts

Channel:
Apex Hours

3 CI Workflow with GitHub Actions (Salesforce Developers)

<https://www.youtube.com/watch?v=ZU1bJkGlxkk>

Focus:

- Continuous integration
- Automated testing
- Workflow automation

Channel:
Salesforce Developers

CORE TASKS (MANDATORY)

Task 1 Deployment Pipeline Thinking

Suppose your college management system is used by:

- 50,000 students
- 500 faculty

- multiple admins

Now explain:

- ☐ Why is directly editing production dangerous?

Think about:

- bugs
 - downtime
 - broken workflows
 - data loss
-

Task 2 Team Collaboration Scenario

Suppose:

- 10 developers work simultaneously.

What problems might happen without:

- GitHub
- branches
- deployment workflow
- testing

Explain clearly.

Task 3 CI/CD Thinking

Explain this workflow:

Developer writes code →
GitHub commit →
Automated testing →
Validation →
Deployment →
Production release

- ☐ Why is each step important?
-

Task 4 Reflection Task

Answer:

☐ What is the difference between:

- “writing code”
and
 - “engineering enterprise software”?
-

☐ GitHub Submission

Create:

/day13-devops-cicd/

README.md must include:

- What is CI/CD?
 - Why deployment workflow matters
 - Problems without version control
 - GitHub + DX + DevOps explanation
 - Enterprise deployment risks
 - Reflection
-

☐ Revision Questions

1. Why is deployment workflow important?
 2. Why should teams avoid editing production directly?
 3. What problems happen without version control?
 4. Why do enterprise systems require CI/CD?
 5. Why should testing happen before deployment?
 6. Why do large teams need branches?
 7. What is rollback and why is it important?
 8. Why are deployment pipelines useful?
 9. Why is DevOps important in modern software engineering?
 10. Why is enterprise software development different from simple coding?
-

☐ ☐ Rules

- Focus on workflow understanding
- Think like an engineering team
- Use real-world reasoning

- Do NOT go too deep into tooling syntax
 - Spend around 4–5 hours maximum
-

☐ **End of Day Outcome**

You should now clearly understand:

- ☐ Enterprise deployment workflow
 - ☐ CI/CD concepts
 - ☐ GitHub-based collaboration
 - ☐ DevOps thinking
 - ☐ Professional software delivery lifecycle
-
